

Simple

Complex

→ ★ generating shape.

→ ★ getting normals (only relevant for tractions or strong form)

FSI foundation:

3

(1) static solids

(2) statics fluids ★

air
(air dynamics)

(FD)

★ more broad.

★ Lit review

need to do/
look into

→ still same
task with
normal &
curved shapes

→ statics fluids
case.

★ Testing / running

4

Accounting

SimS/Benchmarking

★ Best way to generalize?

★ for shapes, dirichlet, loads!

(speed up convergence???)

★ most "tedious" but most "important"

★ Need for all strong, pin, mgn, FEM etc.

★ How to formulate inputs

- X pos.
- Y pos.
- 1-0 for Dir x
- 1-0 for Dir y
- t_x
- t_y
- f

Does it make sense
to define

★ 1-0 for

★ edge/not
edge?

★ free traction

★

Dirichlet
strong

PINN : $\underline{C^*} = \underline{A \text{ Net}(x) + b}$

new function

$A = X$

→

MGN
